01. PROJECT AT A GLANCE

Orbit CRM is an AI-native CRM designed for startups, small businesses, freelancers and growing teams.

It brings contacts, companies, deals, tasks, notes, activities, reports and AI assistance into one workspace.

Core Modules

- Contacts & Companies
 - Deals & Opportunities
 - Tasks & Notes
 - Activities
 - Reports
 - Search
 - Workspace Management
 - AI Assistant
-

02. PROBLEM, USERS & PRODUCT VALUE

Problem

Customer information is often spread across spreadsheets, emails and separate tools, making follow-ups and sales tracking difficult.

Orbit CRM brings these workflows together in one structured workspace.

Target Users

Solo Founders

Manage leads, contacts and deals without spreadsheet dependency.

Sales Managers

Track pipeline, team activity and follow-ups.

Freelancers

Manage clients, notes and tasks from one place.

Product Value

Simple CRM + Connected Data + AI Assistance + Responsive Experience

03. ARCHITECTURE & TECHNOLOGY

Orbit CRM uses a standalone frontend and backend architecture.

Frontend: Next.js + React

Backend: NestJS

Database: PostgreSQL

ORM: Prisma

Authentication: Better Auth

UI: Tailwind CSS + shadcn/ui

State: Zustand

Storage: Cloudinary

AI: OpenRouter

Architecture

User → Next.js → REST API / SSE → NestJS → Prisma → PostgreSQL

04. CORE CRM WORKFLOW

The main CRM workflow connects customer records through the workspace.

**Authentication → Workspace → Dashboard →
Contacts → Companies → Deals → Tasks / Notes /
Activities → Reports / AI**

Users can create and manage records while keeping related customer information connected.

05. FEATURE MAP

Dashboard

Overview of CRM activity and important information.

People / Contacts

Manage individual customers and leads.

Companies

Manage organizations and their associated contacts.

Deals / Opportunities

Track sales opportunities through pipeline stages.

Tasks

Manage follow-ups and assigned work.

Notes & Activities

Store customer context and interaction history.

Reports

Review CRM and business activity.

Search

Quickly find CRM records.

AI Assistant

Interact with CRM information using AI.

Settings

Manage workspace and account configuration.

06. C0 WEB CHAT

C0 Web Chat was used for structured prompting, research, analysis and review.

The workflow helped turn broad requirements into clearer prompts and implementation directions.

Workflow

Requirement → C0 Analysis → CORA Implementation → C0 Review → Refinement

C0 was also used to review generated documentation and create focused follow-up prompts.

07. C0 PROMPT HIGHLIGHTS

C0 was mainly used for:

- Product research
- Architecture analysis
- Requirement planning
- Documentation review
- Prompt refinement
- Implementation planning

Planning Areas

Foundation → Authentication → Core CRM → Search → Data → Settings → Dashboard → AI

The purpose was to turn broad requirements into a structured implementation plan.

Prompts Used

Prompt 1 : Product & Architecture Research

Analyze Orbit CRM as a customized CRM product and study its overall architecture, technology stack, application structure, frontend and backend responsibilities, database layer, major modules and development environment. Break down how the different parts of the system work together and identify the important technical dependencies that need to be considered before implementation. Also highlight any architectural constraints or compatibility considerations that could affect further development of the project.

Prompt 2 : Feasibility & Technical Analysis

Analyze the current Orbit CRM project and evaluate the feasibility of extending and developing the application further while maintaining its existing architecture and project structure. Review the frontend, backend, database, authentication, CRM modules and supporting services, and identify which parts are already available and which areas require additional implementation. Provide a structured technical assessment that can be used as a foundation for planning the next development stages.

Prompt 3 : PRD & Requirement Planning

Create a detailed Product Requirements Document for Orbit CRM covering the product overview, goals, target users, user personas, core CRM workflows, technology stack, system architecture, data model, feature specifications, API requirements and implementation roadmap. Structure the requirements clearly so that they can be translated into development tasks later. Keep the product focused on contacts, companies, deals, tasks, notes, activities, workspace management, search, reporting and AI-assisted CRM functionality.

Prompt 4 : Documentation Review & Refinement

Review the generated Orbit CRM documentation and identify areas where the requirements, architecture, features or implementation details need better structure or clarification. Keep the documentation aligned with the actual project and avoid introducing unsupported functionality. Convert broad or unclear requirements into focused follow-up prompts that can be passed to the development workflow for further implementation and refinement.

08. BUILD: DESIGN MODE + PROTOTYPE MODE

Design Mode

Build Design Mode was used to establish the visual direction of Orbit CRM.

The design focused on:

- Dark premium interface
- Indigo branding
- Editorial typography
- Product-focused sections
- Responsive layouts
- AI-native positioning

Prompts Used

Prompt 1 : Initial Orbit CRM Design

Design a fully responsive, dark-theme landing page for “Orbit CRM”, a modern, production-ready, AI-native CRM for startups, SMBs, and freelancers who have outgrown spreadsheets but cannot afford Salesforce or HubSpot. Create a premium product-focused experience that clearly communicates the CRM's value while making the interface feel like a real production SaaS product rather than a generic dashboard template.

Prompt 2 : Visual Identity & Design System

Establish a distinctive visual system for Orbit CRM using a dark editorial interface with indigo as the primary brand color. Use premium typography, restrained accents, clean spacing, strong visual hierarchy and product-focused UI sections. Avoid generic startup SaaS styling, excessive gradients and unnecessary visual effects. The overall experience should feel polished, trustworthy and production-ready while maintaining a consistent Orbit CRM identity.

Prompt 3 : Product-Focused Landing Page

Create a landing page experience that presents Orbit CRM as an AI-native CRM for fast-moving startups, SMB sales teams and freelancers. Use structured sections, numbered labels and embedded product interfaces to demonstrate the actual CRM experience instead of relying on generic marketing graphics. Include sections that communicate the CRM workflow, core features, AI capabilities and product value while keeping the visual language consistent throughout the page.

Prompt 4 : Responsive Product Experience

Refine the Orbit CRM design into a fully responsive product experience that works cleanly across desktop, tablet and mobile layouts. Preserve the dark editorial visual language, typography, spacing and indigo branding while ensuring navigation, CRM modules, product previews and content sections adapt naturally to different screen sizes. Keep the interface clean and usable without introducing unnecessary visual complexity.

Prototype Mode

The generated design was then taken forward into application development, where the frontend structure, backend, database and CRM functionality were implemented.

Prompts Used

Prompt 1 : Convert Finalized Design into Application

The UI design has been finalized. Do not redesign or change the existing layout, colors, typography, spacing, visual hierarchy or components. Now take the approved Orbit CRM design and start building the actual functional application. Convert the existing prototype into a responsive production-ready CRM with reusable components, proper navigation, dashboard, Contacts, Companies, Deals, Tasks, Notes, Activities, Search and Settings. Preserve the approved Orbit CRM visual language and focus on clean, modular and maintainable implementation.

Prompt 2 : Backend & Database Integration

The current Orbit CRM frontend and UI are already implemented. Do not redesign the interface or modify the existing visual structure. Now connect the application to the backend and database and move the current experience from static or mock data to a functional CRM. Add the required database connection using the provided DATABASE_URL, configure PostgreSQL with Prisma, establish the required schema and connect the CRM entities to persistent data. Ensure the frontend communicates correctly with the backend while preserving the existing UI.

Prompt 3 : CRM Functional Iteration

Continue development of the existing Orbit CRM application without changing the approved design. Implement complete CRUD functionality for Contacts, Companies, Deals, Tasks, Notes and Activities. Establish the correct relationships between CRM entities and ensure that records can be created, viewed, edited and deleted through the application. Replace remaining mock data with real application data, add appropriate loading and empty states, validate forms and handle API or database errors gracefully.

Prompt 4 : End-to-End Application Verification

Review the current Orbit CRM implementation after the backend and database integration. Test the major user flows end-to-end, including authentication, creating CRM records, saving data, fetching records, editing and deleting records, navigation, search and workspace-specific data. Identify any incomplete or inconsistent functionality and implement the required corrections without changing the approved UI. Verify that the final application remains responsive and that existing functionality is not broken.

09. BUILD PROMPT HIGHLIGHTS

The Build prompts focused on creating a production-ready CRM rather than a generic SaaS interface.

Main Prompt Focus

- AI-native CRM
- Startups, SMBs & freelancers
- Dark editorial design
- Indigo visual identity
- Responsive layouts
- CRM-focused product sections
- Realistic application UI

Representative Prompt

Prompts Used

Prompt 1 : Design Foundation

Design a fully responsive, dark-theme landing page for “Orbit CRM”, a modern, production-ready, AI-native CRM for startups, SMBs, and freelancers. Build a premium visual experience with strong product positioning, clear CRM workflows and a polished interface that feels like a real production SaaS application.

Prompt 2 : Product UI

Create product-focused sections for Orbit CRM that showcase the actual CRM experience through embedded UI, including contacts, companies, deals, tasks and AI-assisted workflows. Use a dark editorial visual language, premium typography, indigo branding and clean spacing while keeping the interface focused on the product rather than generic marketing content.

Prompt 3 : Functional Application

The Orbit CRM design has been finalized. Use the approved interface as the source of truth and build the functional application without changing the established visual system. Implement reusable components, navigation, CRM modules, responsive layouts, forms, tables and realistic application interactions while maintaining consistency across the entire product.

Prompt 4 : Functional Iteration

Continue from the existing Orbit CRM implementation and improve the application's functionality without redesigning the UI. Connect the relevant CRM modules to persistent data, implement required CRUD operations, improve forms and interactions, add proper loading and error states, and verify that the main user workflows work correctly across the application.

10. CORA: PLANNING & IMPLEMENTATION

CORA was used as the main implementation and planning layer.

It was used to convert requirements into structured development tasks and implement changes across the application.

CORA was used for:

- Database & Prisma
- Authentication
- Workspace management
- CRM modules
- AI functionality
- Search & data workflows
- Responsive UI
- Bug fixing

Workflow

Requirement → CORA Planning → Implementation → Testing → Fixes

Prompts Used

Prompt 1 : Implementation Planning

Analyze the current Orbit CRM codebase and the requested feature requirements. Before making changes, identify the relevant modules, files, database models, API endpoints, frontend components, dependencies and existing implementation patterns that will be affected. Create a structured implementation plan with clear steps and explain how the changes should integrate with the existing architecture without breaking current functionality.

Prompt 2 : Database & Prisma Implementation

Implement the required Orbit CRM database changes using the existing Prisma and PostgreSQL architecture. Review the current schema and relationships before making modifications, then add or update the required models, fields, constraints and relationships for the requested CRM functionality. Ensure migrations and database operations remain consistent with the existing application and verify that the backend can correctly create, read, update and delete the affected records.

Prompt 3 : Feature Implementation

Implement the requested Orbit CRM feature according to the existing project architecture and UI patterns. Update the necessary backend modules, APIs, database operations and frontend components while preserving the existing design. Make sure the feature integrates correctly with related CRM entities, authentication and workspace access. After implementation, verify the complete workflow and ensure existing functionality continues to work.

Prompt 4 : Testing & Refinement

Review the implemented Orbit CRM changes and test the affected functionality end-to-end. Check the database operations, API responses, frontend states, forms, navigation, responsive behavior and interactions with related CRM modules. Identify any issues or incomplete behavior, isolate the root cause and implement the required fixes. Re-test the complete workflow after the changes and ensure the implementation is stable without introducing regressions.

11. CORA TASK ARCHIVE

Instead of listing every CORA task, the implementation can be grouped into the major areas below.

Architecture

Prisma schema, backend structure and database relationships.

CRM

Contacts, Companies, Deals, Tasks, Notes and Activities.

Authentication

Authentication, workspace creation and onboarding.

Data

Search, CSV workflows, uploads and storage.

AI

AI assistant and workspace-aware functionality.

UI

Dashboard, responsive layouts, forms, selectors and visual fixes.

Debugging

Regression fixes and implementation issues.

12. IMPLEMENTATION MILESTONES

Phase 1: Research

Product understanding, documentation and initial design.

Phase 2: Foundation

Frontend, backend and database setup.

Phase 3: Authentication

Authentication, workspace and onboarding.

Phase 4: CRM Core

Contacts, Companies, Deals, Tasks and Notes.

Phase 5: Productivity

Search, uploads, reports and related workflows.

Phase 6: AI

AI assistant and workspace context.

Phase 7: Refinement

Responsive improvements, UI polish and bug fixing.

13. BACKEND, DATA & INTEGRATIONS

Orbit CRM uses a modular **NestJS + Prisma + PostgreSQL** backend.

The backend handles authentication, CRM records, tasks, notes, activities, reports, search, AI, attachments and workspace functionality.

Integrations

Cloudinary → File storage

SMTP / Nodemailer → Email

OpenRouter → AI

The database uses workspace-level relationships to keep CRM data organized and isolated.

14. AI ASSISTANT & WORKSPACE CONTEXT

The AI Assistant is integrated into the CRM instead of functioning as a separate chatbot.

It can assist with:

- Contact information
- Deal-related questions
- Customer history
- Follow-up drafts
- Suggested actions
- CRM queries

AI Flow

User Question → Workspace Context → CRM Data → Permission Check → AI Response

Conversation history is persisted while workspace context keeps the AI interaction scoped to the appropriate data.

15. RESPONSIVE UI & POLISH

Responsive behavior was considered across the main CRM experience.

Desktop

Full sidebar, dashboards, tables and multi-column layouts.

Tablet

Adjusted navigation and content density.

The image shows a tablet screen displaying the Orbit CRM landing page. The page has a dark theme with white and light blue text and buttons. At the top, there is a navigation bar with the Orbit logo (an eye icon) and the word "Orbit" on the left, and "Sign in" and a "Sign up" button on the right. Below the navigation bar, the text "ORBIT CRM" is displayed in a small, light blue font. The main headline reads "A fast, beautiful CRM you'll actually want to use." followed by a paragraph: "Orbit replaces spreadsheets and overpriced enterprise tools with an AI-native CRM designed for modern startups and small teams. Set up in minutes. Priced for growth." Below this is a "Sign up" button. Further down, the section "FEATURES" is introduced with the headline "Everything you need. Nothing you don't." and a paragraph: "Powerful capabilities, thoughtfully designed for teams that value clarity over complexity." Below the features section, there is a preview of the Orbit CRM interface showing a contact profile for "Rahul Sharma" with fields for Email, Phone, Source, Website, and Last contact. Below the contact profile, there is a section titled "ACTIVE DEALS" showing an "Enterprise License" for ₹42L. To the right of the contact profile preview, the section "CONTACTS & DEALS" is introduced with the headline "One record for every relationship" and a paragraph: "Stop digging through spreadsheets and scattered updates. Every contact, company, and deal lives in one unified profile with complete context - interactions, deal history, and next steps all in a single view." Below this paragraph are two bullet points, each with a green checkmark icon: "Rich contact profiles with timeline" and "Company records with deal context".
