01. PROJECT AT A GLANCE

HRMS is a modern enterprise Human Resource Management System designed to manage the complete employee lifecycle through one connected platform.

The system brings recruitment, onboarding, employee management, attendance, leave, payroll, performance, asset management, helpdesk, permissions, reporting, and employee self-service into a unified HR platform.

HRMS is designed for organizations that need to manage employees across multiple departments, branches, or companies while maintaining centralized employee records and role-based access.

Core Capabilities

- Employee Management
- Recruitment & Hiring
- Onboarding & Offboarding
- Attendance & Time Tracking
- Leave Management
- Payroll
- Performance Management
- Asset Management
- Helpdesk
- Role-Based Access Control
- Multi-Company Administration
- Employee Self-Service
- Manager Workspace
- Reporting & Analytics
- Administration Settings

The employee record acts as the central foundation of the HRMS, allowing information to flow across attendance, leave, payroll, performance, and other HR workflows.

02. PROBLEM, USERS & PRODUCT VALUE

Problem

Many small and mid-size organizations manage HR operations through separate tools, spreadsheets, manual records, and disconnected systems.

Payroll may be handled separately from attendance, recruitment may use another platform, leave may be tracked manually, and employee information may be stored across multiple locations.

This creates duplicate data entry, inconsistent records, limited visibility, and difficulty maintaining a single reliable source of employee information.

Users

Administrator

Manages company configuration, system settings, integrations, permissions, backups, and overall HRMS administration.

HR Staff

Handles day-to-day HR operations including employee management, recruitment, onboarding, attendance, leave, payroll, and other assigned HR activities.

Manager

Manages team-level operations including attendance approvals, leave approvals, performance reviews, recruitment tracking, and employee development.

Employee

Uses the self-service portal to manage personal HR activities such as attendance, leave, payslips, claims, assets, goals, onboarding, and support tickets.

Job Candidate

Applies for jobs, tracks applications, completes hiring-related activities, and participates in onboarding after selection.

Product Value

- Centralized employee information
 - Complete employee lifecycle management
 - Recruitment and onboarding workflow
 - Attendance and leave tracking
 - Integrated payroll management
 - Performance management
 - Employee self-service
 - Manager workspace
 - Role-based access
 - Multi-company support
 - HR reporting and analytics
 - Helpdesk and support management
-

03. CUSTOMER PERSONA

Primary Persona: HR Administrator / HR Manager

Goal: Manage the organization's complete employee lifecycle and HR operations from one centralized platform.

Needs

- Complete employee information in one place
- Recruitment and hiring management
- Employee onboarding
- Attendance and leave visibility
- Payroll processing
- Performance tracking
- Employee self-service
- Manager approvals
- Role and permission management
- Company and branch administration
- HR reports and analytics

Pain Points

- Employee information spread across multiple tools
- Manual attendance and leave tracking
- Disconnected payroll and HR records
- Difficulty tracking recruitment progress
- Repetitive onboarding processes
- Limited employee self-service
- Lack of centralized HR visibility
- Complex permission management
- Difficulty managing multiple companies or branches

HRMS Solution

HRMS provides a centralized platform where administrators, HR staff, managers, employees, and candidates can access the HR workflows relevant to their roles.

The system connects the employee lifecycle from recruitment and onboarding through attendance, leave, payroll, performance, support, and offboarding.

04. ARCHITECTURE & TECHNOLOGY

HRMS follows an enterprise SaaS architecture designed to connect employee data with multiple HR workflows.

Technology

Frontend: React.js

Styling: Tailwind CSS

Application Architecture: Modular SaaS Architecture

Backend: Node.js + Express.js

Database: PostgreSQL / Relational Database

Authentication: Role-Based Authentication

State Management: Application-level state management

Navigation: React Router

API Layer: REST APIs

Architecture

User → React Application → API Layer → Backend Services → Database

The architecture is designed around a shared employee record that acts as the foundation for connected HR modules.

Core Architecture Principles

- Modular HR workflows
- Reusable components
- Centralized employee records
- Role-based access
- Multi-company data separation
- Secure data access
- Audit history
- Responsive user experiences
- Scalable enterprise structure

The HRMS requirements specifically define multi-company data separation, secure connected-app access, activity history, data import/export, backups, and easy deployment as important system requirements.

05. CORE HRMS WORKFLOW

The main HRMS workflow connects the complete employee lifecycle and day-to-day HR operations.

Recruitment → Hiring → Onboarding → Employee Management → Attendance → Leave → Payroll → Performance → Assets → Helpdesk → Offboarding

Workflow

Candidates can apply through the recruitment workflow and move through defined hiring stages.

Once selected, candidate information can be converted into an employee record without requiring HR teams to enter the same information again.

Employees then become part of the organization's central employee database, which connects their attendance, leave, payroll, performance, assets, and support activities.

Managers and HR staff can review and approve relevant requests based on their assigned permissions.

Employees can access their own HR information through the self-service portal.

HRMS Lifecycle

Candidate → Hired → Onboarding → Active Employee → Attendance & Leave → Payroll → Performance → Support → Offboarding

06. FEATURE MAP

Employee Management

Manage employee profiles, departments, designations, branches, employment history, documents, bank details, emergency contacts, skills, certifications, and other employee information.

Recruitment

Manage job postings, candidate applications, hiring stages, interviews, evaluations, offers, talent pools, skill matching, and candidate surveys.

Onboarding

Manage digital onboarding, document collection, welcome portal, task checklists, equipment allocation, and policy acknowledgment.

Attendance & Time Tracking

Manage clock-in/out, daily attendance, attendance calendars, team attendance, work-from-home, overtime, late arrivals, early departures, shift changes, and attendance analytics.

Leave Management

Manage leave types, policies, balances, leave requests, approvals, holidays, team availability, leave history, and leave analytics.

Payroll

Manage salary structures, earnings, deductions, reimbursements, payroll processing, approvals, payslips, payroll history, loans, taxes, and payroll reports.

Performance Management

Manage employee goals, key results, feedback cycles, 360-degree reviews, performance meetings, and bonus points.

Asset Management

Manage employee assets and related allocation information throughout the employee lifecycle.

Helpdesk

Allow employees to raise HR or IT support tickets, access FAQs, and submit claim requests.

Employee Self-Service

Employees can manage profiles, attendance, leave, payslips, claims, assets, goals, onboarding tasks, announcements, calendars, and support tickets.

Manager Workspace

Managers can view their teams, approve attendance and leave, conduct performance reviews, track recruitment, view analytics, and manage employee development.

Administration

Manage company settings, branches, departments, designations, leave policies, attendance rules, payroll rules, holidays, integrations, notifications, backups, API keys, and audit logs.

Permissions

Manage roles, permissions, teams, multi-company access, security policies, activity history, and audit logs.

These modules are based on the HRMS feature scope defined in the PRD.

07. BUILD: DESIGN MODE

Objective

Create a premium, enterprise-grade Human Resource Management System as a unified SaaS platform for complete employee lifecycle management.

The design should provide a polished, trustworthy, scalable, and workflow-driven HR experience rather than a collection of disconnected HR screens.

Design Direction

- Modern enterprise SaaS interface
- Premium and professional visual language
- Clean information hierarchy
- High information density without clutter
- Responsive layouts
- Data-first dashboards
- Reusable components
- Clear navigation
- Accessible UI
- Consistent typography
- Consistent spacing
- Smooth micro-interactions
- Light and dark theme support
- Mobile-friendly employee self-service

The Build Design Mode specification defines the HRMS as a scalable enterprise product with responsive desktop, tablet, and mobile experiences.

Design System

The design system includes:

- Typography
- Color palette
- Light and dark themes
- Grid system
- Iconography
- Buttons
- Inputs
- Dropdowns
- Tables
- Cards
- Charts
- Calendars
- Kanban

- Timelines
- Modals
- Drawers
- Tabs
- Navigation
- Toasts
- Empty states
- Error states
- Success states
- Status badges
- Avatars
- Search and filters
- Bulk actions
- Confirmation dialogs

The design system is intended to remain reusable and consistent across all HRMS modules.

Design Screens

Build Design Mode was used to establish experiences for:

Executive Dashboard

Organization-level HR analytics, employee statistics, attendance, leave, payroll, recruitment, performance, assets, tickets, announcements, calendar, and pending approvals.

Employee Directory

Central employee listing with employee information, filters, search, status indicators, and employee management actions.

Manager Hub

Team overview, attendance, approvals, performance, team analytics, recruitment, and employee development.

Recruitment

Job listings, candidate profiles, hiring pipeline, interviews, evaluations, and offers.

Attendance

Daily attendance, clock-in/out, team attendance, calendars, and attendance analytics.

Leave

Leave balances, requests, approvals, holiday calendar, team availability, and leave analytics.

Payroll

Salary structures, payroll processing, payslips, deductions, reimbursements, approvals, and reports.

Employee Self-Service

Employee profile, attendance, leave, payslips, claims, assets, goals, onboarding, announcements, and support.

The HRMS Build Prompt Sheet includes the executive dashboard, Employee Directory, and Manager Hub as key generated design experiences.

08. BUILD: PROTOTYPE MODE

Objective

Convert the approved HRMS designs into a functional and responsive enterprise HR application without changing the established visual direction.

Implementation

Build was used to take the approved HRMS design and move it toward a functional application experience covering:

- Executive Dashboard
- Employee Management
- Recruitment
- Onboarding
- Attendance
- Leave Management
- Payroll
- Performance
- Asset Management
- Helpdesk
- Employee Self-Service
- Manager Workspace
- Administration
- Role-Based Access
- Reports and Analytics

Application Requirements

The implementation should preserve:

- Existing design direction
- Typography
- Colors
- Spacing
- Component structure
- Navigation patterns
- Responsive layouts
- HRMS workflows
- Reusable components

Functional Experience

The application should support connected HR workflows rather than isolated pages.

Employee information should be reusable across attendance, leave, payroll, performance, and other HR modules.

The approved design was intended to provide a complete production-ready HRMS UI/UX system with reusable components, responsive layouts, dashboards, analytics, and connected user journeys.

09. BUILD PROMPT HIGHLIGHTS

Design Mode

Prompt 1 : HRMS Product Experience

Design a premium, enterprise-grade Human Resource Management System as a single unified SaaS platform for end-to-end employee lifecycle management. The product should feel modern, scalable, trustworthy, workflow-driven, and production-ready, with the operational depth expected from enterprise HR software. Build a connected HR ecosystem covering recruitment, onboarding, employee management, attendance, leave, payroll, performance, assets, helpdesk, employee self-service, manager workspace, administration, reporting, and role-based access. Use a clean enterprise interface with strong information hierarchy, high information density without clutter, responsive layouts, reusable components, professional typography, consistent spacing, clear states, and intuitive workflows. Every module should feel like part of the same HRMS rather than an isolated product.

Prompt 2 : Executive Dashboard & Employee Management

Create the central HRMS executive dashboard and employee management experience. The dashboard should provide an immediate overview of total employees, new hires, active employees, employees on leave, attendance today, late arrivals, payroll status, recruitment funnel, performance summary, asset utilization, open support tickets, upcoming birthdays, work anniversaries, company announcements, calendar events, pending approvals, team productivity, and organization insights. Use KPI cards, interactive charts, timelines, trend indicators, real-time widgets, and drill-down interactions. Create a complete Employee Directory with search, filtering, employee status, department, designation, manager, employee profiles, organizational structure, employment history, documents, bank details, emergency contacts, skills, certifications, and other employee information. Keep the interface premium, data-focused, responsive, and easy to navigate.

Prompt 3 : Recruitment, Onboarding & HR Workflows

Design the complete employee lifecycle experience starting from recruitment and continuing through onboarding. Include career website, job listings, job details, candidate applications, resume viewing, candidate profiles, hiring pipeline Kanban, interview scheduling, candidate evaluation, offer management, talent pool, skill matching, and candidate surveys. Candidates should be able to browse jobs, apply without creating a full account, upload resumes and documents, track application status, receive interview updates, and accept offers. After hiring, provide a guided onboarding experience with candidate-to-employee conversion, document collection, welcome portal,

onboarding checklist, task ownership, equipment allocation, policy acknowledgment, progress tracking, and visibility for HR and managers. Maintain a clear connection between recruitment, onboarding, and the central employee record.

Prompt 4 : Attendance, Leave, Payroll & Self-Service

Create connected HRMS experiences for Attendance, Leave, Payroll, and Employee Self-Service. Attendance should include clock-in/out, daily attendance, live attendance dashboard, attendance calendar, team attendance, work-from-home, overtime, late and early analytics, shift management, and geolocation attendance where applicable. Leave should include leave balances, policies, requests, approvals, holidays, team availability, history, and analytics. Payroll should include salary structures, earnings, deductions, reimbursements, payroll processing, approvals, payslips, payroll history, reports, loans, and tax rules. Create a mobile-friendly employee self-service portal where employees can view profiles, clock in/out, apply for leave, view attendance, download payslips, submit claims, view assets, raise support tickets, view goals, complete onboarding tasks, read announcements, and check their calendar. Keep all workflows connected to the employee record.

Prototype Mode

Prompt 1 : Start Development From Approved Design

The HRMS design has been finalized. Do not redesign or change the approved layout, typography, colors, spacing, navigation, components, or visual hierarchy. Now convert the existing HRMS design into a functional production-ready application. Preserve the established enterprise SaaS visual system and implement the application using reusable components and clean architecture. Start with the core application shell, navigation, dashboard, employee management, responsive layouts, reusable tables, cards, forms, modals, filters, status badges, and common UI states. Ensure the implementation works consistently across desktop, tablet, and mobile while keeping the approved design intact.

Prompt 2 : Core HRMS Functionality

Continue the HRMS implementation by connecting the core functional modules to the existing application structure. Implement Employee Management, Recruitment, Onboarding, Attendance, Leave, Payroll, Performance, Assets, Helpdesk, Manager Workspace, Employee Self-Service, and Administration. Employee information must act as the central record shared across the HR workflows. Implement realistic forms, tables, search, filtering, sorting, approval flows, status updates, dashboards, calendars, charts, and reusable

components. Preserve the existing UI exactly and focus on functionality, maintainability, validation, responsive behavior, and consistent user flows.

Prompt 3 : Database & Role-Based Workflows

Connect the HRMS application to the backend and database and implement the required data workflows. Create the necessary structures for companies, employees, departments, branches, candidates, jobs, onboarding tasks, attendance, leave requests, payroll records, performance data, assets, support tickets, users, roles, permissions, and activity history. Ensure employee information is shared correctly across connected modules and company data remains isolated in multi-company environments. Implement role-based access for administrators, HR staff, managers, employees, and candidates. Managers should only access and approve records belonging to their authorized teams, while employees should only access their own permitted information. Do not use mock data for core workflows once the database integration is available.

Prompt 4 :Final Functional HRMS Iteration

Complete and refine the HRMS application without changing the approved visual design. Verify the complete workflow from recruitment through onboarding, employee management, attendance, leave, payroll, performance, assets, helpdesk, employee self-service, manager approvals, administration, and offboarding. Review all forms, navigation, tables, filters, dashboards, approval states, permissions, loading states, empty states, success states, error handling, and responsive layouts. Fix broken flows and inconsistent behavior while preserving the existing architecture and UI. Ensure the final product feels like one connected enterprise HRMS where employee data, permissions, workflows, and actions remain consistent across all modules.

10. CORA: PLANNING & IMPLEMENTATION

CORA was used throughout the HRMS application development process for architecture planning, implementation, workflow development, role-based access, database integration, HR module development, UI refinement, testing, and application verification.

Main Objectives

- Plan the HRMS architecture
- Establish the employee data foundation
- Implement employee management
- Implement recruitment
- Implement onboarding
- Implement attendance
- Implement leave management
- Implement payroll
- Implement performance management
- Implement asset management
- Implement helpdesk
- Implement employee self-service
- Implement manager workspace
- Implement administration
- Implement role-based access
- Support multiple companies
- Connect HR workflows
- Verify application behavior
- Refine responsive UI

Planning Flow

Project Planning → Architecture → Employee Data Foundation → Module Implementation → Workflow Integration → Role & Permission Validation → Testing → Debugging → Refinement

The HRMS architecture is centered around the employee record, which is intended to provide shared information to attendance, leave, payroll, and other HR workflows.

CORA PROMPT HIGHLIGHTS

Prompt 1 : HRMS Architecture & Employee Data Foundation

Review the existing HRMS application and establish a scalable architecture for managing the complete employee lifecycle. Treat Employee Management as the central foundation of the system and ensure that every employee has one master record that can be referenced by recruitment, onboarding, attendance, leave, payroll, performance, assets, and support workflows. Implement employee information including personal details, department, designation, manager, shift, work type, employment history, bank details, documents, emergency contacts, skills, certifications, disciplinary notes, and bonus points. Ensure the system supports multiple companies or entities while keeping employee data isolated by company. Preserve the existing application structure and avoid unnecessary rewrites. Focus on clean data relationships, reusable services, consistent validation, secure access, and a scalable foundation for all downstream HR modules.

Prompt 2 : Recruitment, Onboarding & Employee Lifecycle

Implement the complete HRMS recruitment and onboarding workflow. Candidates should be able to browse available jobs and submit applications without requiring a full employee account. HR users should be able to manage job postings, candidates, hiring stages, interviews, evaluations, offers, talent pools, skill matching, and candidate surveys. Once a candidate is selected and hired, convert the candidate into an employee record while preserving the information already collected during recruitment and avoiding duplicate data

entry. Automatically initiate the onboarding workflow with onboarding tasks, document collection, welcome information, equipment allocation, policy acknowledgment, progress tracking, and task ownership. Ensure HR and managers can clearly monitor onboarding status and that the lifecycle remains connected from Candidate → Hired → Onboarding → Active Employee.

Prompt 3 : Attendance, Leave & Payroll Integration

Implement the connected Attendance, Leave, and Payroll workflows for the HRMS. Attendance must support employee clock-in/out, timestamps, daily attendance, team attendance, work-from-home, shift changes, overtime, late arrivals, early departures, and authorized bulk updates. Leave management must support leave types, company policies, leave balances, requests, manager approvals, HR approvals, holiday calendars, team availability, history, and analytics. Employees should not be able to request leave beyond their available balance unless the policy explicitly allows it, and holidays must not reduce leave balances. Connect approved attendance and leave information to payroll calculations. Payroll must support salary structures, earnings, deductions, reimbursements, taxes, loans, repayments, payslips, payroll processing, approvals, and payroll history. Ensure payroll calculations remain auditable and protect sensitive payroll and bank-detail operations through appropriate permissions and approval workflows.

Prompt 4 : Role-Based Access & Employee Self-Service

Implement the complete role-based access and employee self-service system for the HRMS. Support Administrators, HR Staff, Managers, Employees, and Job Candidates with clearly defined access boundaries. Administrators should manage company configuration, permissions, branches, departments, policies, payroll rules, integrations, backups, notifications, and audit logs. HR Staff should manage the HR operations permitted by their assigned role. Managers should only access and approve records belonging to their authorized teams. Employees should have access to their own profile, attendance, leave, payslips, claims, assets, goals, onboarding tasks, announcements, calendar, and support tickets. Enforce permissions consistently across all HRMS modules and ensure unauthorized users cannot access restricted information. Support multi-company access while keeping each company's HR data separate. Maintain activity history for important changes so the system can identify who changed what and when.

11. CORA TASK ARCHIVE

Employee Management

CORA was used to implement and refine:

- Employee Directory
- Employee Profiles
- Employee Creation
- Employee Editing
- Employee Archiving
- Department Management
- Designation Management
- Branch Management
- Organizational Chart
- Manager Assignment
- Employment History
- Employee Documents
- Bank Details
- Emergency Contacts
- Skills
- Certifications
- Disciplinary Notes
- Bonus Points
- Employee Search
- Employee Filtering

Recruitment

- Job Listings
- Career Website
- Job Details
- Candidate Applications
- Resume Upload
- Resume Viewer
- Candidate Profiles
- Hiring Pipeline

- Interview Scheduling
- Candidate Evaluation
- Offer Management
- Talent Pool
- Skill Matching
- Candidate Surveys
- Application Status

Onboarding

- Candidate-to-Employee Conversion
- Digital Onboarding
- Welcome Portal
- Onboarding Checklist
- Document Collection
- Equipment Allocation
- Policy Acknowledgment
- Task Ownership
- Progress Tracking
- HR Visibility
- Manager Visibility

Attendance

- Clock In / Clock Out
- Daily Attendance
- Live Attendance Dashboard
- Attendance Calendar
- Team Attendance
- Work From Home
- Shift Management
- Work-Type Changes
- Late Arrival Tracking
- Early Departure Tracking
- Overtime
- Attendance Updates
- Attendance Analytics

Leave

- Leave Types
- Leave Policies
- Leave Balances
- Leave Requests
- Approval Workflow
- Holiday Calendar

- Team Availability
- Leave History
- Leave Analytics
- Balance Validation

Payroll

- Salary Structure
- Earnings
- Deductions
- Reimbursements
- Payroll Processing
- Payroll Approval
- Payslip Generation
- Payslip Viewer
- Payroll History
- Loans
- Loan Repayments
- Tax Rules
- Payroll Reports
- Payroll Audit
- Dual Approval

Performance

- Employee Goals
- Key Results
- Team Goals
- Feedback Cycles
- 360-Degree Reviews
- Performance Meetings
- Performance Tracking
- Bonus Points

Employee Self-Service

- Employee Profile
- Attendance
- Clock In / Out
- Leave Requests
- Payslips
- Claims
- Assets

- Support Tickets
- Goals
- Onboarding
- Announcements
- Calendar

Manager Workspace

- Team Overview
- Attendance Approval
- Leave Approval
- Performance Reviews
- Recruitment Tracking
- Team Analytics
- Employee Development
- Workload Planning
- Quick Approvals

Administration

- Company Settings
- Multi-Company Management
- Branches
- Departments
- Designations
- Leave Policies
- Attendance Rules
- Payroll Rules
- Holidays
- Integrations
- API Keys
- Email Templates
- Notifications
- Backups
- Audit Logs

Helpdesk

- Support Tickets
- FAQ
- Claim Requests
- Ticket Tracking
- Ticket Assignment
- Ticket Resolution

12. IMPLEMENTATION MILESTONES

01. Planning

Defined the HRMS product scope, employee lifecycle, user roles, core modules, and enterprise requirements.

02. Design

Created the HRMS visual system and application experiences using Build Design Mode.

03. Employee Management

Established the central employee management experience and employee information structure.

04. Recruitment

Implemented job listings, candidate applications, hiring stages, interviews, evaluations, and offer management.

05. Onboarding

Implemented candidate-to-employee conversion, onboarding tasks, document collection, equipment allocation, and progress tracking.

06. Attendance & Leave

Implemented attendance tracking, clock-in/out, leave balances, requests, approvals, holidays, and team availability.

07. Payroll

Implemented salary structures, earnings, deductions, reimbursements, payroll processing, payslips, approvals, and reports.

08. Performance & Employee Experience

Implemented goals, feedback, performance reviews, employee self-service, claims, assets, announcements, and employee workflows.

09. Role-Based Access

Implemented role-specific access for administrators, HR staff, managers, employees, and candidates.

10. Testing & Refinement

Used CORA to investigate implementation issues, refine workflows, verify access rules, and improve application behavior.

13. BACKEND, DATA & INTEGRATIONS

HRMS uses a centralized backend and database structure to connect employee information with the different HR workflows.

Core Data

- Companies
- Users
- Employees
- Departments
- Designations
- Branches
- Candidates
- Jobs
- Applications
- Interviews
- Onboarding Tasks
- Attendance
- Leave Types
- Leave Requests
- Holidays
- Payroll
- Payslips
- Salary Structures
- Reimbursements
- Loans
- Performance Goals
- Reviews
- Assets
- Support Tickets
- Notifications
- Roles
- Permissions
- Audit Logs

Data Relationships

The Employee record acts as the central reference point for multiple HR workflows.

Employee → Attendance

Employee attendance records are associated with the employee's work and schedule information.

Employee → Leave

Leave requests and balances are connected to the employee and relevant company policies.

Employee → Payroll

Payroll uses employee salary information together with attendance and approved leave as inputs for pay calculations.

Employee → Performance

Goals, feedback, reviews, meetings, and bonus points are associated with employee records.

Employee → Assets

Assets can be assigned and tracked against employee records.

Employee → Helpdesk

Employees can raise and track support tickets through the HRMS.

Multi-Company Data

HRMS supports businesses with more than one company or entity while keeping employee data separated by company.

The PRD specifically requires HR data to remain separated by company for multi-company environments.

14. AUTHENTICATION & USER MANAGEMENT

HRMS uses role-based authentication and access control to ensure users can access only the HRMS features relevant to their responsibilities.

User Flow

Login → Company Context → User Role → Permission Validation → Role Workspace → Authorized HRMS Modules

Roles

Administrator

Manages company configuration, system settings, permissions, integrations, backups, and audit information.

HR Staff

Manages employees, recruitment, onboarding, attendance, leave, payroll, and other HR activities according to assigned permissions.

Manager

Accesses team-level workflows such as attendance approvals, leave approvals, performance reviews, recruitment tracking, and employee development.

Employee

Accesses their own employee information and self-service HR activities.

Job Candidate

Accesses recruitment-related experiences without requiring a full employee account.

Access Control

The system controls access using:

- Roles
- Permissions
- Teams
- Company-level access
- Audit Logs
- Activity History
- Security Policies

Managers should only be able to act on records belonging to their own authorized teams, while employees should only access information belonging to themselves and their company.

The PRD explicitly requires restricted access to follow the same rules across the website and connected applications.

15. RESPONSIVE UI & POLISH

HRMS follows a modern enterprise SaaS design approach focused on usability, consistency, accessibility, and information clarity.

UI Characteristics

- Enterprise-grade interface
- Responsive layouts
- Consistent spacing
- Professional typography
- Reusable components
- Data-focused dashboards
- Tables and structured data views
- Interactive charts
- Calendar interfaces
- Kanban workflows
- Timeline views
- Status badges
- Search and filters
- Bulk actions
- Smooth interactions
- Clear loading states
- Empty states
- Error states
- Success states
- Accessible contrast
- Light and dark themes
- Mobile-friendly employee self-service

Mobile

Collapsed navigation, stacked layouts and touch-friendly interactions.

Tablet

Adjusted navigation and content density.

Desktop

Full sidebar, dashboards, tables and multi-column layouts.

Responsive Experience

The HRMS design is intended to work across:

Desktop → Tablet → Mobile

The employee self-service experience is especially focused on fast, mobile-friendly access with minimal clicks and clear primary actions.

Final Product Experience

The final HRMS experience brings together:

Recruitment → Onboarding → Employee Management → Attendance → Leave → Payroll → Performance → Assets → Helpdesk → Employee Self-Service → Manager Workspace → Administration

The goal is to provide one connected HR platform where employee information, permissions, approvals, and HR workflows remain consistent across the entire employee lifecycle.
